

MailNexus Pro

Enterprise Gmail Account & Google Maps Automation Platform

“Process 100 Gmail accounts in 2-4 hours instead of 2 weeks. Every account gets its own IP and browser identity so Google can’t detect automation.”

Client Overview & Feature Brief

Prepared for client review

What is MailNexus Pro?

MailNexus Pro is a professional Windows desktop application that automates bulk Gmail account management at scale. It can run **up to 10 accounts in parallel**, each with its own proxy IP and unique browser fingerprint, so Google sees them as 10 different real users — not bots.

Built on Electron + Python + Playwright, the platform handles everything from password rotation and 2FA setup to Google Maps review posting and account appeal management — all from a single dashboard with live monitoring and Excel-based reporting.

Who is it for?

- **Digital marketing agencies** managing dozens to hundreds of client Gmail accounts.
- **Google Maps / GMB reputation management** services posting and managing reviews at scale.
- **Account security teams** performing bulk credential rotation and 2FA rollouts.
- **Businesses** automating the full Google account lifecycle — create, secure, maintain, appeal.

The Bottom Line

One operator with MailNexus Pro can do the work of 20 people doing it manually. It eliminates the repetitive clicking, login challenges, and verification steps that make Gmail management painful — turning days of work into hours.

The 4 Core Workflows

MailNexus Pro is organized into four independent workflows. Each one can be run on its own or chained together for a complete account lifecycle pipeline.

1. Account Cleanup & Language Setup

Before any other operation runs, this step normalizes all accounts so they behave uniformly — no broken automation from mixed languages or lingering “suspicious activity” warnings.

Feature	Client Benefit
Set Language to English	All accounts behave uniformly. Eliminates automation breakage caused by foreign-language Google UI.
Clear Suspicious Activity	Removes Google’s “we noticed unusual activity” warnings that would otherwise block further actions.
Safe Browsing On / Off	Centralized control over each account’s security posture across the whole batch.

2. Full Security Suite — 14 Operations

Complete account hardening or credential rotation. Add, update, or remove every Google security setting across hundreds of accounts in one run.

Feature	Client Benefit
Change Password	Bulk rotate passwords for security compliance or after a handover.
Recovery Phone — Add / Remove	Manage recovery contacts at scale with one Excel sheet.
Recovery Email — Add / Remove	Same for backup recovery emails.
Authenticator (2FA) — Generate / Remove	Roll out app-based 2FA in bulk. The new TOTP secret is saved back to Excel automatically.
Backup Codes — Generate / Remove	Auto-generates 10 backup codes per account, written into 10 dedicated Excel columns.
2FA Phone — Add / Remove	SMS-based 2FA management.
Remove All Devices	Force-logout from every device an account is signed into. Critical for handed-over or stolen accounts.
Change Account Name	Bulk rename accounts (first + last name) — useful for rebranding or impersonation cleanup.
Security Checkup	Runs Google’s own security audit on every account.

Why this matters: Manually, full security hardening is ~10 minutes per account. 100 accounts $\approx$ 16+ hours. With MailNexus Pro: under 2 hours.

3. Google Maps Review Management

The marquee feature for reputation-management and GMB agencies. Post, verify, and clean up Google Maps reviews at scale — with proof-of-delivery share links for every published review.

Feature	Client Benefit
Write Reviews (R3)	Post star ratings (1-5) with custom review text on any Google Maps listing.
Smart Status Verification	After posting, the bot polls up to 5 times to confirm the review actually went LIVE — not stuck in “pending”.
Auto-Delete Stuck Reviews	If a review fails to publish, the bot cleans it up automatically so the account stays in good standing.
Share Link Extraction	Every successfully posted review’s public URL is captured in Excel — proof of delivery for your client.
Delete All Reviews (R1)	Wipe an account’s entire review history in one click.
Delete Draft Reviews (R2)	Remove only the pending / unpublished reviews, leaving live ones intact.
Profile Lock On / Off (R4 / R5)	Hide or unhide the account’s public Maps contribution profile.
Multi-language Support	Reviews can be posted in English, French, German, Spanish, or Italian.

Why this matters: A reputation agency posting 500 reviews/month manually would need a full-time employee. MailNexus Pro automates the whole pipeline and hands back a share-link report you can give directly to the client as proof.

4. Account Appeal Management

For suspended or flagged accounts. Submit and track appeals across an entire portfolio at once.

Feature	Client Benefit
Submit Appeal (A1)	File appeals in bulk for suspended accounts using custom messages from Excel.
Delete Refused Appeals (A2)	Clean up rejected appeals so you can re-submit with a fresh message.
Live Status Check (A3)	Poll current appeal status across all accounts in one batch run.

Anti-Detection — Why Google Doesn't Catch It

Bulk Gmail automation lives or dies on whether Google's anti-bot systems catch you. MailNexus Pro ships with a multi-layer stealth system designed for long-running production workloads on real client accounts.

Feature	Client Benefit
Per-Worker Browser Fingerprint	Each parallel worker gets a unique OS, Chrome version, and User-Agent. Google sees 10 different "people", not 10 copies of the same bot.
SOCKS5 Proxy Bridge	Each account routes through a separate IP. Full support for authenticated residential SOCKS5 proxies (which Playwright doesn't support natively).
Auto Timezone Matching	The browser's timezone is auto-detected from the proxy's geographic IP location — so a US proxy doesn't look like it's running from Asia.
Stealth Chromium Flags	Disables the standard automation signals Google checks for (<i>navigator.webdriver</i> , <i>AutomationControlled</i> , etc.).
Isolated Chrome Profiles	Every worker has its own persistent browser profile. Cookies, cache, and sessions never leak between accounts.
Accept-Language Header Sync	HTTP headers match the target locale — consistent with the proxy region and account language.

Client benefit: Accounts don't get flagged or banned for "suspicious activity" — which is the #1 way bulk-management tools normally burn out client accounts.

Smart Login System

Google throws a different login challenge almost every time. MailNexus Pro detects and resolves each one automatically — without operator intervention.

Login Screen	How the Bot Handles It
Email + Password	Standard credential entry, retried on flaky network.
2FA Codes (TOTP)	Codes generated on-the-fly from the secret stored in Excel using pyotp.
Backup Codes	Pulled from the per-account backup code columns in Excel.
Recovery Email Confirm	Auto-confirms the displayed recovery email from Excel.
Recovery Phone Confirm	Same for recovery phone numbers.
Account Creation Year	Reads the value from Excel and submits it.
Forced Password Change	Accepts the new password prompt and writes the new password back to Excel.
CAPTCHA / Block Screens	Detects the block, logs the account safely, and moves on to the next one.

Client benefit: Operators don't babysit logins. The bot handles every Google challenge screen — and when something genuinely cannot be solved (like a hard CAPTCHA), it logs the account and continues rather than crashing the whole batch.

Real-Time Dashboard & Reporting

Operators get total visibility into every running job. Clients get clean Excel reports.

Feature	Client Benefit
Live Statistics	Counters update in real time: Total / Success / Failed / Pending.
Progress Bar	Percentage-based progress across the whole batch.
Current Account Indicator	Shows exactly which account is being processed right now.
Live Terminal Log	Real-time log streaming via Server-Sent Events — every action is visible as it happens.
Auto-Generated Reports	After a run, three Excel files are produced: success report, failed report, and a summary report.
Excel In, Excel Out	No databases, no special software. Clients can read, edit, and hand off the file to anyone.

Client benefit: Total transparency. They see what worked, what didn't, and exactly why — with a clean audit trail in a single Excel file they already know how to use.

Excel-Based Input & Output

Everything MailNexus Pro does is driven by a single Excel file with 40+ columns. The bot reads credentials and instructions from it — and writes results, new passwords, new 2FA secrets, backup codes, review share links, and appeal status straight back into the same file.

Feature	Client Benefit
Single Source of Truth	One .xlsx file covers every operation across all 4 workflows.
Per-Account Operations	Each row tells the bot which operations to run for that account (e.g. 1,2a,3a,7,8).
Auto-Populated Outputs	Status, Operations Done, Error Message, new 2FA Secret, Backup Codes, Review Share Links, Appeal Status — all written back automatically.
Thread-Safe Writes	Multiple workers can safely write to the same Excel file at the same time without corruption.
Auditable & Portable	No database lock-in. Hand the file to a teammate, attach it to an email, archive it — it's self-contained.

Performance — The Real Numbers

Concrete time savings for typical workloads. Numbers assume residential proxies and the default 10-worker configuration on a 4-core / 8GB workstation.

Scenario	Manual	With MailNexus Pro
Single account — full security run	10-15 minutes	2-5 minutes
100 accounts — security hardening	~25 hours of labor	~2-4 hours, 1 operator
500 Google Maps reviews / month	1 full-time employee	~3 evening sessions
Bulk appeal submission (50 accounts)	1 full working day	~30-40 minutes
Password rotation (200 accounts)	~30 hours	~3 hours

System Requirements

Component	Minimum	Recommended
Operating System	Windows 10	Windows 11
CPU	2 cores	4+ cores
RAM	4 GB	8+ GB (for 10 workers)
Disk	500 MB free	1 GB free
Internet	Required	Residential proxies recommended

The Bottom-Line Pitch

“Process 100 Gmail accounts in 2-4 hours instead of 2 weeks. Every account gets its own IP and browser identity so Google can’t detect automation. Whether it’s security hardening, posting Google Maps reviews with verified share links, or filing appeals for suspended accounts — MailNexus Pro does it in parallel, logs everything, and hands you back an Excel report you can give to your client.”

Why Clients Win

Feature	Client Benefit
10x Throughput	Up to 10 accounts processed in parallel — one operator does the work of a team.
Zero Babysitting	Smart login system handles every Google challenge screen automatically.
Proof of Delivery	Every Google Maps review comes back with a public share link in Excel.
Audit Trail	Auto-generated success / failed / summary Excel reports for every run.
Account Safety	Multi-layer anti-detection keeps accounts out of Google’s flag systems.
Plug & Play	Single Windows installer. No database setup, no command line. Excel in, Excel out.
